

Prove that a trade document is valid — **today and ten years from now** — no matter which platform issued it.

Shipping is going paperless faster than the law and the archives can follow. We build the verification and long-term evidence layer underneath: standards-based, platform-independent, quantum-ready.

1.2% → ~11%

Electronic bill of lading share, 2021→2025 (DCSA). Nine carriers committed to 100% by 2030.

9 July 2027

EU eFTI Regulation applies: authorities must accept electronic freight data.

10 years

Statutory retention for trade documents. No platform guarantees verifiability that far out.

THE GAP

A bill of lading issued digitally in Shanghai is worth nothing in Istanbul if the bank, the customs officer or the court cannot check it without asking the issuing platform.

Every eBL platform is a closed world: its own keys, its own registry, its own definition of "valid". Cargo that starts electronic abroad turns back into paper at the Turkish border — and when a platform's certificate expires, or the platform disappears, the evidence goes with it. DCSA's own reading: the brake is not technology, it is trust and legal recognition.

WHAT WE BUILD

1

Read anything

TradeTrust / OpenAttestation, DCSA eBL envelopes, qualified e-signatures and seals — parsed without the issuing platform's software.

2

One policy engine

X.509 trust lists, platform key registries and issuer-domain proofs resolved in a single policy, producing an ETSI EN 319 102-1 equivalence report.

3

Evidence that survives

A sealed evidence package — hybrid ECDSA + ML-DSA-65 (FIPS 204) — that stays verifiable after certificates, platforms and algorithms expire.

Two faces, one engine. Outward: a neutral verification layer that sits under international eBL platforms, banks, insurers and customs. Inward: a sovereign Turkish leg for eBL, e-CMR and eFTI — so that digital cargo does not have to become paper again while national law catches up with MLETR.

PROOF, NOT SLIDEWARE

- **Working engine, running in your browser.** Seven test cases — valid chains, tampered documents, deleted transfers, unknown platforms — all with real cryptography, no server round-trip.
- **Cross-verified.** The same evidence packages validate in two independent implementations and against OpenSSL.
- **Honest about limits.** Sample documents are synthetic; on-chain registry lookups and qualified timestamps land in the pilot phase.

Try it in 30 seconds

Open platform.maresign.com → **Verification Lab**. Pick case 1: a bill of lading issued in Shanghai, endorsed to a bank, moved across two platforms, surrendered to an Istanbul agent. The engine names the current holder and proves the chain — then breaks it when one byte changes.

WHY NOW

2026	2027	2028–30	2030+
DCSA platform interoperability live; NIST post-quantum signatures standardised.	EU eFTI mandatory, 9 July — Turkish carriers to the EU must comply.	Carrier commitment to 100% eBL; first ten-year archives fall due.	Post-quantum migration deadlines across EU critical infrastructure.
MLETR-based legislation is in force in 13 jurisdictions (UNCITRAL) — UK, Singapore, France, China among them. Türkiye has not adopted it yet: exactly the gap our sovereign leg bridges.			

HOW WE MAKE MONEY

LINE	WHO PAYS	WHY THEY PAY
Verification API per transaction	Banks, customs brokers, agencies, insurers	They must accept documents they cannot check. One call returns a defensible verdict.
Evidence archive per document / year	Shippers, carriers, forwarders	Ten-year retention with a seal that still verifies at year ten, post-quantum included.
Platform licence annual, per deployment	eBL platforms, national single windows	Buy the trust layer instead of building it; interoperability without owning cryptography.

WHERE WE ARE

- DONE** Concept proven with real cryptography (TRL 3), documented and reproducible.
- DONE** Public demo live; R&D application filed with Bilişim Vadisi technology park.
- NEXT** Pilot with a Turkish container owner and its Istanbul agency — real documents.
- NEXT** 24-month programme to TRL 7, with banks and customs in the loop.

Built on a signed partnership. Qualified signatures, seals and identity come from ArkSigner, an established Turkish trust service provider. We do not rebuild cryptography or certificate authorities — we build the layer above: policy engine, equivalence report, evidence package.

Defensibility. The hard part is not signing; it is deciding, defensibly, that a foreign document is valid under local rules — and proving that decision a decade later. Standards, law and archive engineering combined; it compounds with every trust source we onboard.

TEAM

Gökçen Özkan FOUNDER & CEO

Master Mariner, 20 years at sea, flag state surveyor. Knows the document chain from the bridge, the port and the regulator's side. TR/EN/ES/RU.

Dila Özkan CO-FOUNDER

Business development in digital trust and qualified electronic signature; enterprise and public sector channel.

Advisory IN FORMATION

PKI-experienced senior engineering, academic cryptography review, trade-finance advisors.

What we are looking for

We are not raising a priced round today. We want pilot partners — carriers, agencies, banks, customs — and strategic investors who want to be in the room before the 2027 deadline turns this into a procurement question. Scan and watch the engine run before you decide.
